QORTARA AGENT GOVERNANCE · DEVELOPER RESOURCE

Agent Governance quickstart

Agent Governance developer adapter

The open-source Qortara Governance adapter is in alpha. It checks supported LangChain and LangGraph tool actions against rules before they run. It builds on Microsoft Agent Governance Toolkit. The planned managed app and Qortara Logic are separate products.

Install the adapter in a separate Python environment:

```
pip install qortara-governance-langchain
```

To run policy checks in your own process, start with `qortara_governance.init_agt(...)` and an `AgentContext`. The repository README has the current setup steps. Use the package integration guide for allowed tools, LangGraph hooks, supported versions, and examples. The alpha API may change, so check the repository for updates.

The local adapter does not need a public Qortara account. Hosted policy services and the managed app have their own release and agreement requirements. Check access status before trying to connect a customer account.
